Keras-CV Object Detection

Live ((•))

Imen Masmoudi

@WTM Ambassador

Agenda

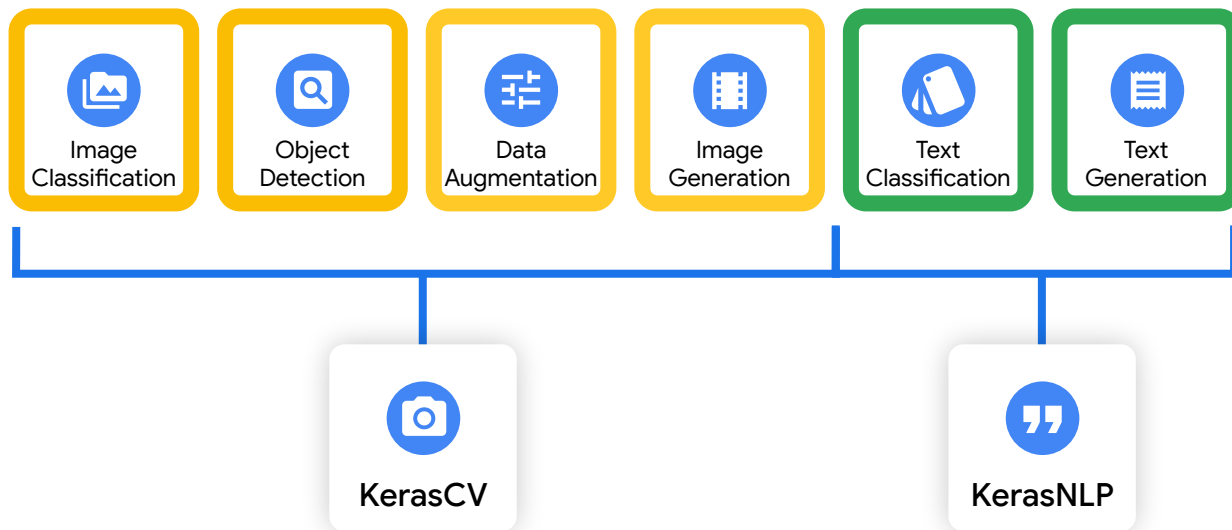

1. Applied ML with Keras-CV & Keras-NLP
2. Keras-CV for Object Detection
3. From Matplotlib to Open-CV
4. Live Demo

Applied ML with Keras-CV & Keras-NLP

What can you do with KerasCV and KerasNLP?

Libraries for state of the art **computer vision** and **natural language processing**.
From idea to implementation in just a few lines of code!

Why KerasCV and KerasNLP?

**SOTA models,
written in minutes**

BERT, GPT-2, Stable Diffusion, ResNet,
RetinaNet, etc.

**Integrated with
the TF Ecosystem**

TFLite, DTensor, XLA, TPUs, and beyond

**Easy to
get started**

Readable and modular design with
great documentation

What can you do with KerasCV?

Image Classification

1

1

1

0

1

0

```
from keras_cv.models import (  
    ResNetBackbone, ImageClassifier,  
)  
  
backbone = ResNetBackbone.from_preset(  
    "resnet50_imagenet",  
)
```

```
from keras_cv.models import (  
    ResNetBackbone, ImageClassifier,  
)  
  
backbone = ResNetBackbone.from_preset(  
    "resnet50_imagenet",  
)  
model = ImageClassifier(  
    backbone=backbone,  
    num_classes=2,  
)
```

```
from keras_cv.models import (  
    ResNetBackbone, ImageClassifier,  
)  
  
backbone = ResNetBackbone.from_preset(  
    "resnet50_imagenet",  
)  
model = ImageClassifier(  
    backbone=backbone,  
    num_classes=2,  
)  
model.compile(...)  
model.fit(cat_vs_dog_dataset)
```

Data Augmentation

```
from keras_cv.layers import (
    CutMix, MixUp, RandAugment, RandomFlip,
)

augmenter = keras.Sequential(
    [
        RandomFlip(),
        RandAugment(value_range=(0, 255)),
        CutMix(),
        MixUp(),
    ],
)

train_dataset = flowers_dataset.map(augmenter)
```

Image Generation

Text to image

```
from keras_cv.models import (  
    StableDiffusion,  
)  
  
model = StableDiffusion(  
    img_width=512,  
    img_height=512,  
)  
  
images = model.text_to_image(  
    "photograph of an astronaut "  
    "riding a horse",  
    batch_size=3,  
)
```

Object Detection

Keras-CV for Object Detection

Here's a quick look!

Want to learn more? Take a deep dive in our full talk on KerasCV/NLP!

[Object Detection](#)

From Matplotlib to Open-CV

Let's Explore!

The prediction:

```
[ ] 1 type(y_pred)
```

```
dict
```

```
[ ] 1 len(y_pred)
```

```
4
```

```
[ ] 1 y_pred.keys()
```

```
dict_keys(['boxes', 'confidence', 'classes', 'num_detections'])
```

Let's Explore!

The prediction:

```
[ ] 1 type(y_pred['boxes'])
```

```
numpy.ndarray
```

```
[ ] 1 y_pred['boxes'].shape
```

```
(1, 100, 4)
```

Let's Explore!

The prediction:

```
[ ] 1 type(y_pred['confidence'])  
      numpy.ndarray
```

```
[ ] 1 y_pred['confidence'].shape  
      (1, 100)
```

Let's Explore!

The prediction:

```
[ ] 1 type(y_pred['classes'])
```

numpy.ndarray

```
[ ] 1 y_pred['classes'].shape
```

(1, 100)

Let's Explore!

The prediction:

```
[ ] 1 type(y_pred['num_detections'])  
      numpy.ndarray
```

```
[ ] 1 y_pred['num_detections'].shape  
      (1,)
```

Now into action!

Open CV

```
y_pred = pretrained_model.predict(image_batch)
for i in np.arange(0, y_pred['num_detections'][0]):
    confidence = y_pred['confidence'].numpy()[0, i]
    if confidence > 0.5:
        idx = int(y_pred['classes'].numpy()[0, i])
        if class_ids[idx] == class_ids[14]:
            cow_box = y_pred['boxes'].numpy()[0, i, :]
            (startX, startY, w, h) = cow_box.astype("int")
            (startX, startY, endX, endY) = (startX, startY, startX + w, startY + h)
            cv2.rectangle(image, (startX, startY), (endX, endY), (0, 255, 0), 5)
```

Live Demo
